Author review checklist

Longitudinal Motor-Imagery EEG Decoding: Frozen Baselines, Supervised Recalibration, and Task-Measurement Reliability

These are unresolved author, institutional and publication details for the working draft and supplementary methods. They are not new experiment requirements or authorization to change the frozen analyses. Leave an item pending until the responsible authors supply the actual facts.

Retrieved identity and working journal format

At the user's direction, the fixed first-paper commit `d9a11926076bd348696f6e690078955921dac3f8` was read without modifying that project. Its manuscript byline and submission fields agree:

- Author/corresponding author: **Ziyuan Zhu (朱子元)**.
- Affiliation: **College of Artificial Intelligence Medicine, Chongqing Medical University, Chongqing, China**.
- Correspondence: **zzy2630816871@gmail.com**.
- Postal address: Jinyun Campus, Chongqing Medical University, No. 61, Daxuecheng Middle Road, Shapingba District, Chongqing 401331, China.
- Author-supplied ORCID: **0009-0005-1153-4926**. The first-paper record notes reversed given/family profile fields; this work did not recheck or alter that profile and does not claim the correction is complete.
- Working journal/article format: **PLOS ONE / Research Article**. This carries forward formatting information, not first-paper approval to submit this paper.

Only these requested identity/format fields were reused. Contribution, funding, competing-interest, ethics, exclusivity and publication-approval declarations remain specific to the second paper and require actual author confirmation. The exact source URLs, excerpts and byte hashes are retained in the manuscript completion evidence directory's `paper1_author_reference/identity_reference.json`.

Authorship and institutional details

- ☐ Confirm the retrieved Ziyuan Zhu byline, affiliation and contact details are current for this manuscript, and verify the ORCID profile's given/family fields before linking it in a submission system.
- ☐ Agree the actual contribution statement and approval/accountability of every author. Use the journal's contribution taxonomy if required; do not infer contributions from repository activity or assign authorship to tools.
- ☐ Supply actual funding, grant identifiers and relevant acknowledgments, including an explicit no-funding statement only if the authors confirm it.
- ☐ Obtain each author's competing-interest disclosure. Do not replace missing disclosures with a fabricated statement of no competing interests.

Secondary-data ethical determination and source qualifications

- □ Obtain the responsible institution's determination for this secondary analysis and its required wording: approval, exemption, waiver, non-human- subjects determination, or an applicable policy explaining why no review is required. Supply an actual identifier and date only where they exist.
- □ Review the source ethics/consent attribution against the material actually available. The derivative metadata attributes original collection approval to the University of Texas at Austin, protocol `2020-03-0073`; this is not approval of this project, and informed-consent wording has not independently been verified from accessible full text. No consent or institutional approval claim should be invented to fill the manuscript section.
- □ Confirm the source-description wording and citations: Kumar2024 is the original study, while NEMAR `nm000177/v1.0.5` is the analyzed derivative release. Attribute original-study demographic or collection claims to their source rather than presenting them as independently established here.
- □ Retain the documented limitations when approving final wording: published IDs do not independently verify biological identity; `age=2020` is an invalid placeholder, GR/PAR mapping is unresolved, and derivative timestamps and CPz metadata have the stated provenance limits. Do not infer missing demographic or behavioral information.

Data, code, reference and journal statements

- □ Confirm that the Data Availability statement names the exact release, its CC BY 4.0 terms and required attribution, and distinguishes public source access from private project weights, EEG copies and binary evidence. Do not promise public artifacts that have not actually been released.
- □ Have the rights holders choose and approve the repository's software license, verify the actual license file and upstream obligations, and align the Code Availability statement with that decision. The dataset's CC BY 4.0 license does not itself license this project's software. A missing software license must not be described as an established open-source license.
- □ Review the supplied verification of core bibliography metadata and each citation's intended scope, and confirm final reference completeness. The exact NEMAR version DOI and the original article's published correction have been checked against official records; this does not imply full-text review of every article or verification of the original consent statement. Distinguish original Kumar collection, NEMAR derivative version, CSP/shrinkage methods and the actual EEGNet/Braindecode implementation. Do not claim that an inaccessible paper was fully read or fabricate citation details or support from its abstract/metadata.
- □ Confirm the carried-forward PLOS ONE target and apply its actual article format, abstract/word limits, figure/table specifications, reporting forms and data/code/AI-assistance disclosure requirements where applicable. Confirm author approval of the final wording and any required submission declarations.
- □ Verify that the final cited code/evidence version and all public artifact links are the versions actually released. A repository commit, private R2 backup and manuscript submission are separate actions; do not describe any unpublished release or submission as completed.

This checklist does not ask for more fitting, new query evaluation, a new adaptation strategy or additional participants. The completed scientific results and their limitations remain as recorded; administrative completion does not make the analysis confirmatory or establish a validated adaptive gate.
