Author review checklist

Longitudinal Motor-Imagery EEG Decoding: Frozen Baselines, Supervised Recalibration, and Task-Measurement Reliability

This checklist separates the author's actual eight-item reply from the remaining institutional and publication work for the working draft and supplementary methods. It authorizes no experiment, change to frozen analyses, release or submission.

Identity and eight author confirmations

Identity was retrieved at the user's direction from first-paper fixed commit `d9a11926076bd348696f6e690078955921dac3f8`, without modifying that project: **Ziyuan Zhu (朱子元)**; College of Artificial Intelligence Medicine, Chongqing Medical University, Chongqing, China; **zzy2630816871@gmail.com**. Postal address: Jinyun Campus, Chongqing Medical University, No. 61, Daxuecheng Middle Road, Shapingba District, Chongqing 401331, China. The byline and submission fields agree; the source excerpts and hashes are in the earlier manuscript-completion evidence. The present confirmations come directly from this paper's author, rather than from first-paper declarations.

- ☒ **1 — ORCID:** author reports that Given name / Family name have been corrected to Ziyuan / Zhu for **0009-0005-1153-4926**. The current profile was not independently queried or changed by this task.
- ☒ **2 — Authorship and contributions:** author confirms all work was independently undertaken by the sole human author, Ziyuan Zhu, with no other authors. CRediT: Conceptualization; Methodology; Software; Formal analysis; Validation; Visualization; Writing – original draft; Writing – review & editing. AI assistance is disclosed separately; this reply is not final manuscript approval.
- ☒ **3 — Funding:** no specific funding for this work.
- ☒ **4 — Competing interests:** none declared.
- ☒ **5 — Current institutional status recorded:** author reports **no conclusion yet** for the secondary analysis. This records an unresolved status; it does not satisfy or waive the institutional requirement below.
- ☒ **6 — Restrictions:** author reports no institutional or collaborator restrictions on public code or derived results. No software license is thereby granted, and no unreviewed public artifact release is represented as complete.
- ☒ **7 — Journal target: PLOS ONE / Research Article** confirmed.
- ☒ **8 — Publication history:** no prior preprint or conference publication and no concurrent journal consideration reported.

Exact original reply, question mapping, observation time and inference limits are retained in the author confirmation record. No additional author acknowledgment, funding identifier or project approval is invented.

Still needed from the author or responsible institution

- ☐ Obtain the institution's actual secondary-analysis determination and applicable wording: approval, exemption, waiver, non-human-subjects determination, or a policy explaining why review is not required. Supply a date or identifier only if one exists. **Current answer: no conclusion yet.** Original-study approval is not approval of the present project.

- ☐ Review the complete final manuscript, contribution statement and truthful AI-assistance disclosure, and confirm final author approval and accountability before submission. A reply supplying factual declarations is not that approval.
- ☐ Decide a specific software license and public-release scope after the actual dependency/rights review and a concrete release list are supplied. No project software LICENSE file has been established; the dataset's CC BY 4.0 terms do not license this project's software. No restrictions is a rights declaration, not an instruction to publish all stored artifacts.

Editorial and source checks we continue to handle

- ☐ Verify original ethics/consent attribution using material actually available. Frozen derivative metadata attributes original collection approval to the University of Texas at Austin, protocol **2020-03-0073**. Original consent wording has not been independently verified from accessible full text; do not invent it or treat source metadata as this project's institutional conclusion.
- ☐ Complete PLOS ONE formatting, reporting, data/code availability and AI-assistance disclosure checks using current journal instructions. Citation style and a journal target alone do not establish submission readiness.
- ☐ Complete license/dependency review and prepare a concrete public-release list; verify final cited code/evidence versions and links actually released. Private R2 backups and Git commits are not journal submission or public data release.
- ☐ Retain verified reference scope: Kumar2024 and its published correction, exact NEMAR version DOI, and original methods references. Metadata verification does not imply full-text review of inaccessible papers or original consent.
- ☐ Retain provenance limitations: published IDs do not independently prove biological identity; `age=2020` is an invalid placeholder; GR/PAR mapping, derivative timestamps and CPz metadata have the documented limits. Do not infer missing demographics, behavior or human-learning outcomes.

All results, participant-level statistics, unequal label budgets, negative and collapsed outcomes and prior test-exposure/exploratory labels remain unchanged. Administrative completion establishes no adaptive gate, skill-retention or clinical effect and releases no additional fitting or query evaluation.
