

sub-01: distinct behavioral, decoding, and EEG endpoints

One EEG participant, 4 sessions, 717 stored task windows; descriptive comparisons only

Spectra: C3/Cz/C4, CAR across 74 channels, 0.5-4.5 s after the stored task marker, equal run weights; task windows may include feedback. Negative values mean lower MI power.

Task-window contrasts are not baseline-normalized ERD. QC flags are a coarse sensitivity screen. Geometry/spectral resampling ranges are not population confidence intervals.

Online target-hit %, offline BA, and geometry measure different quantities; their separation does not estimate a human learning gain or a causal decoder effect.
