PLOS ONE author worksheet

Paper: Longitudinal motor-imagery EEG decoding: Frozen baselines, supervised recalibration, and task-measurement reliability

Purpose: final author review and later entry into the PLOS ONE submission system. This worksheet is not part of the scientific manuscript, is not a journal form already submitted, and does not grant new experimental permissions. The eight earlier factual answers have already been recorded.

Recorded submission fields

Field	Current truthful entry
Journal / article type	PLOS ONE / Research Article; author confirmed
Full title	Longitudinal motor-imagery EEG decoding: Frozen baselines, supervised recalibration, and task-measurement reliability
Short title	Longitudinal EEG decoding with limited recalibration labels
Sole and corresponding author	Ziyuan Zhu
Affiliation	College of Artificial Intelligence Medicine, Chongqing Medical University, Chongqing, China
Correspondence email	zzy2630816871@gmail.com
Postal address	Jinyun Campus, Chongqing Medical University, No. 61, Daxuecheng Middle Road, Shapingba District, Chongqing 401331, China
ORCID	0009-0005-1153-4926; author reports Given name Ziyuan / Family name Zhu correction. This task did not independently refresh the profile. The author should link the actual ORCID in the journal account.
Contributions	Ziyuan Zhu: Conceptualization; Methodology; Software; Formal analysis; Validation; Visualization; Writing – original draft; Writing – review & editing. These queried roles were author confirmed.
Financial disclosure	The author received no specific funding for this work. Enter in the financial-disclosure portal field; do not import the original study's funding or reinsert financial disclosure in the upload manuscript.
Competing interests	The author declares no competing interests.
Preprint / conference version	None reported by the author.
Concurrent journal consideration	None reported by the author.

Field	Current truthful entry
Institutional/collaborator restrictions	None reported for original code or derived results; the subsequent scoped MIT/CC BY choice is recorded below and does not eliminate third-party terms.
Prior contact with PLOS	Not yet supplied; do not assume none. Record any real editorial correspondence if relevant.
Academic Editor suggestions / opposed reviewers	Not yet selected. Do not invent names, affiliations, contacts, conflicts or opposition reasons.

Identity/affiliation/contact were retrieved at the author's direction from first-paper fixed commit `d9a11926076bd348696f6e690078955921dac3f8`. Paper-2 declarations come from the author's actual eight-item reply recorded in `research_logs/kumar_author_confirmation_20261015/run01/author_confirmation.json`; first-paper funding, ethics and final-approval statements were not transferred.

Administrative status and remaining submission fields

1. Applicable ethical basis for this secondary analysis

Current status: institution-confirmed exemption from additional ethical review under Article 32, item (1), as reported by the author.

The author reports that the research administration office at Chongqing Medical University confirmed this exemption for the Kumar2024/NEMAR secondary analysis on 16 October 2026. The author explicitly reported that no identifier was issued. The office name is a descriptive English translation of the unit reported by the author; its official English name has not been verified. No institutional document has been received for this record.

Article 32, item (1), of the 2023 Chinese ethics-review measures permits exemption when the applicable conditions are met [1]. Public availability and coded participant identifiers alone do not establish non-sensitivity or irreversible anonymization. The reported confirmation is an exemption from additional review, not a new IRB approval or a consent waiver; 16 October 2026 is the reported confirmation date, not evidence of approval before the analysis.

The original paper's Methods report University of Texas at Austin protocol 2020-03-0073 and written informed consent. Relevant original Methods were checked in the official full-text XML obtained during this revision; earlier indexed-reading and retrieval-failure records remain historical evidence. These facts support attribution about the original collection, not a new institutional decision for this project. Do not sign a human-participants checklist with a fabricated approval or treat public availability as an automatic exemption.

Author-reported institutional response: confirmed exemption from additional review; research administration office at Chongqing Medical University; confirmation date 16 October 2026; no identifier issued. Source: the author's statement, recorded separately in `research_logs/kumar_ethics_statement_revision_20261016/run01/author_statement_record.json`.

2. Scoped licensing: author choice completed

The author explicitly selected the previously presented scope: MIT for original project code and CC BY 4.0 for original derived data, figures and manuscript content, with raw EEG, third-party code, CSL,

CUDA and other third-party items excluded or retaining their existing terms. The actual reply was "确认按上述限定范围激活". This choice is implemented in the root `LICENSE`, `LICENSING.md` and complete texts under `LICENSES/`; it is no longer pending.

The grant covers only the author's rights. Provider metadata retain source attribution and terms. Braindecode's optional noncommercial components, CSL CC BY-SA styles, packages, fonts and CUDA are not relabeled as MIT or bundled as CC BY article content. License acceptance is distinct from ethics clearance and from the author's final scientific approval.

3. Final personal review, AI disclosure and accountability

The actual AI assistance included software/validation, saved-result arithmetic, figures, source/reference checking, drafting/editing and exports; it was more than language polishing. OpenAI ChatGPT/Codex is disclosed in Methods and is not an author. Technical evidence includes exact identity/hash joins, original-endpoint reconstruction, synthetic tests, saved-arithmetic validation, portable public-input replay and rendered-document/figure inspection. Those checks were themselves AI-assisted and are not a substitute for the author's personal review or independent human replication.

The author confirmed reading and personally checking the scientific manuscript content and approved it on 16 October 2026. The following topics remain a review guide, not an itemized account of checks supplied by the author:

- Primary 12-participant contrast and secondary equal-label-budget contrast; all seeds, negative outcomes and class collapse; 54 models versus 18 participant identities; historical test exposure.
- Cue-anchored five-second window interpretation, missing trial-level phase evidence and recording-boundary partial exclusions.
- Exploratory QC rules, missing-class groups and two unavailable five-session sensitivity endpoints; retained artifacts in historical training/validation.
- Source-query EEGNet weakness, complete saved histories and the limits of interpreting training/evaluation-mode loss differences.
- Citation accuracy/read-scope records, ethics attribution, data dictionary, active scoped licensing and full manuscript/appendices/figure captions.

Personal checks reported by the author: reading and personal checking, with AI assistance for grammar corrections and data checks. No itemized reference/table checklist, independent human replication or native Word rendering was reported. This brief description does not narrow the full AI-assistance disclosure above.

Approval of the scientific manuscript content: received, dated 16 October 2026, for content commit `f2901decfc39b2adecae13253ee4b1159a4f9a4b`, tag `paper2-plos-source-20261016`. The confirmation is preserved at commit `1a7e1ab8b6253db52544ba185abb33a6bcb4937b`. The new administrative revision is designated `paper2-plos-ethics-20261016`; the prior approval does not establish that the author personally inspected each new export byte or its native Word layout. No journal submission is authorized or performed by this worksheet.

4. Portal-only author entries at actual submission

Record any real prior interaction with PLOS, editor/reviewer suggestions or exclusions, any acknowledgment requiring another person's consent, and the reported institutional confirmation above. No additional acknowledgment, endorsement, manuscript ID, submission date, ethics certificate or archived-release DOI has been generated or inferred.

Package separation and format qualification

The actual upload manuscript should be image-free with editable tables, continuous line/page numbers and double spacing. Figures are separate uploads; the illustrated PDF/Word copy is for the author's review. The supporting item names are S1 Text, S2 Text and S1 Data and must match their actual filenames and final captions.

Current production TIFFs preserve actual DPI/geometry/RGB/LZW checks. The installed renderer uses Liberation Sans as an Arial-compatible substitute; strict Arial/Times/Symbol family compliance has not been established. Preserve this qualification rather than marking every PLOS production requirement complete. An actual portal check is still needed before submission.

The scientific manuscript content was approved by the author on 16 October 2026. The reported institutional exemption and its provenance are recorded above; this administrative version does not assert a new IRB approval or consent waiver. Licensing remains active within its stated scope. Journal acceptance and formal submission have not been asserted.
